

REST API

Please note

The REST API documentation below applies to versions 6.0 and above. If you're using an earlier version (such as 5.8) please refer to the [Sisense V5 documentation](#).

Introduction

What is the Sisense "REST" API?

Sisense provides advanced users and developers a RESTful web API to most of its server functionalities, from user management to manipulating dashboards & widgets.

A web API can be used in several ways which we will discuss below.

What can I use the Sisense API for?

There are plenty of possible uses, but let's outline the central ones with some examples:

- **Use Sisense data in your application or website**
For example: you could implement a widget in your own corporate website that takes data from Sisense using the JSON Analytical Query Language (JAQL) or standard SQL and the `query API`.
- **Automate a process**
For example: you could write a script that adds multiple users from a CSV file, using the `users API`.
- **Implement your own UI on top of Sisense**
For example: you could develop an elaborate dashboard navigation page to function as a "home page" for your organization, using the `dashboards API`.
